Add09 Inhibitory link

❖ The Objective is to show how inhibitory link works

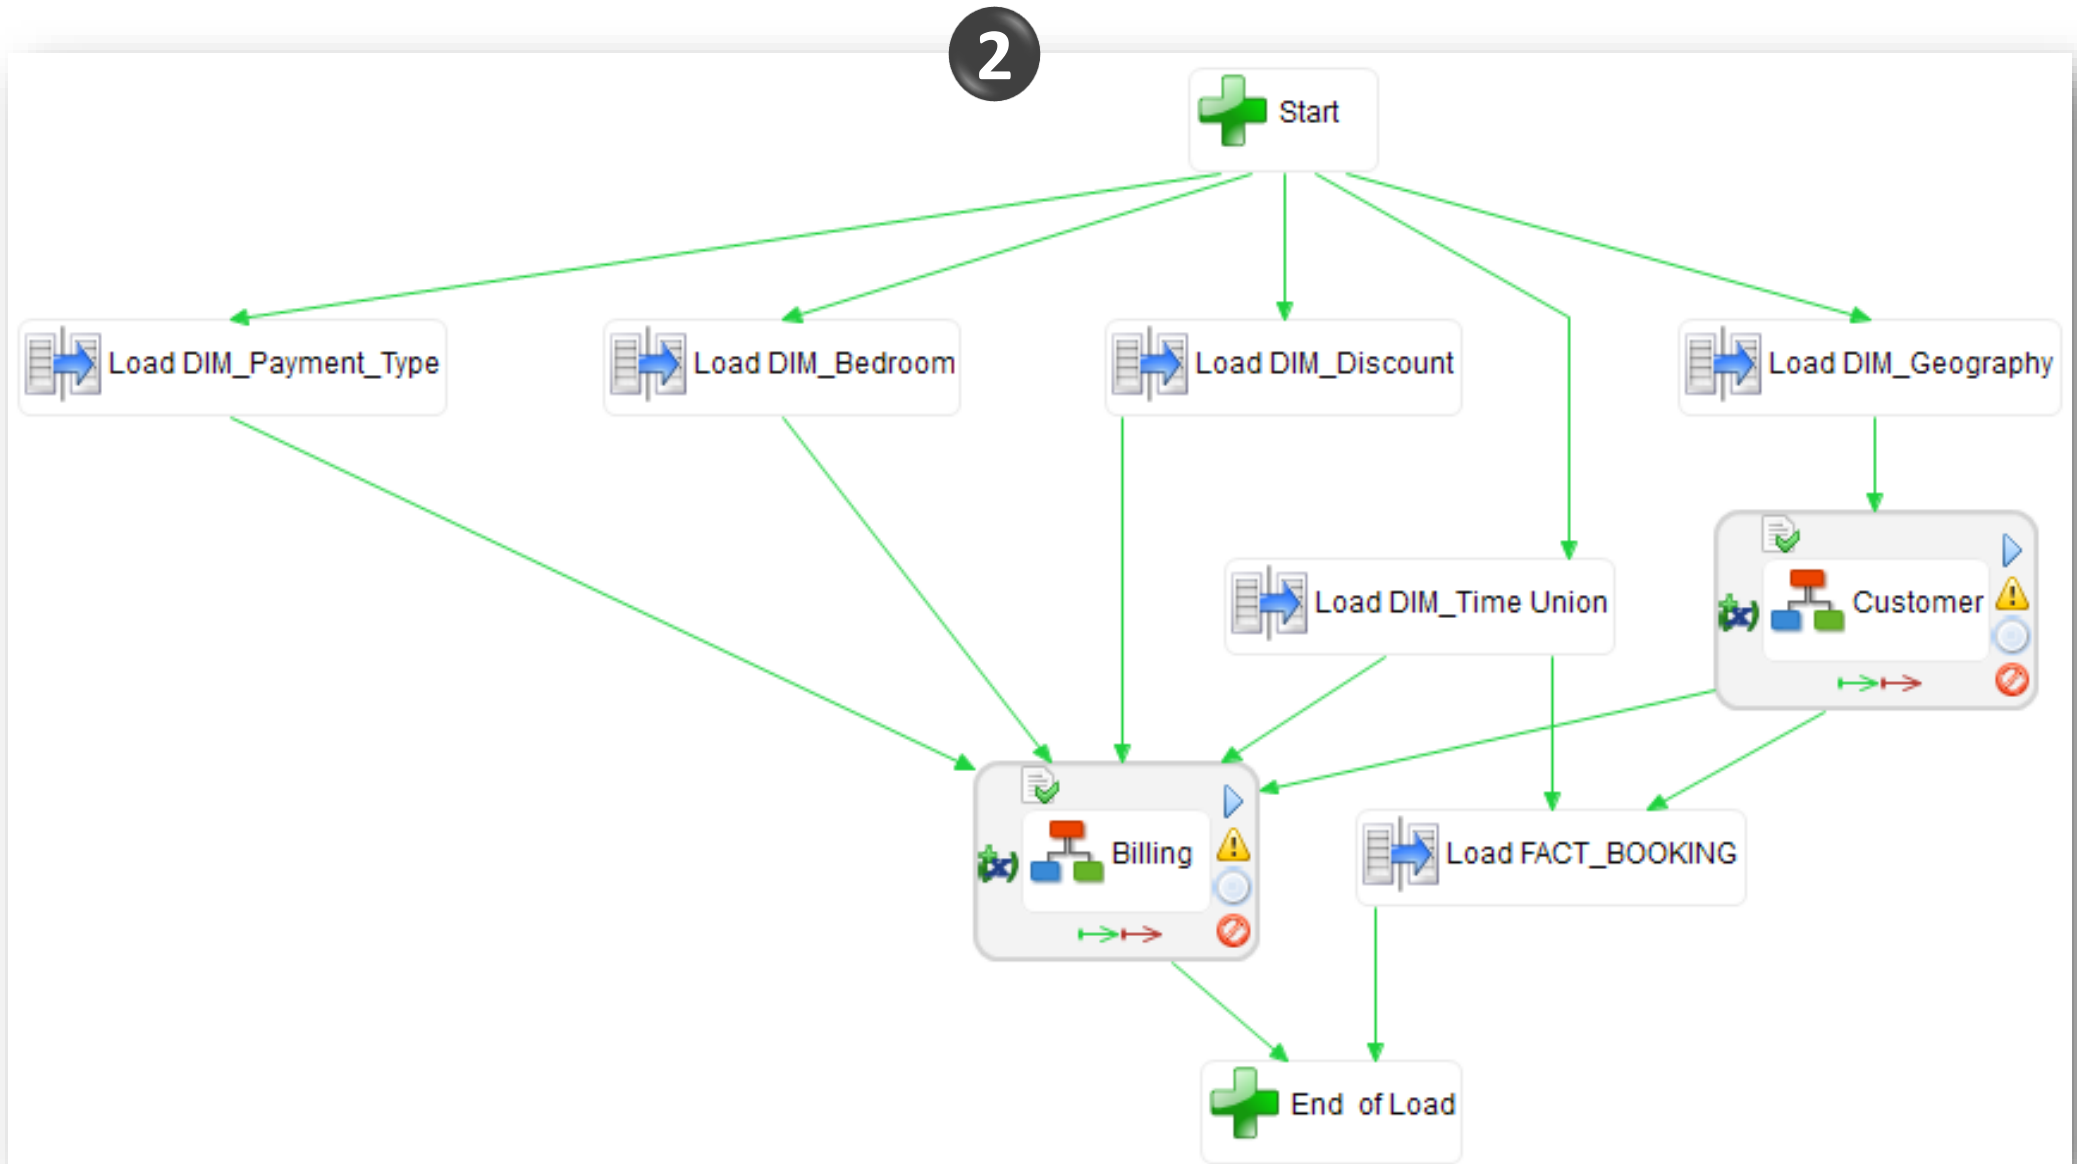

- An inhibitory link allows to execute the target action of an inhibitory link only if the source of the link is not executed
- To show the operation, you will execute mapping with or without rejects and test if there is a reject to set a warning or not

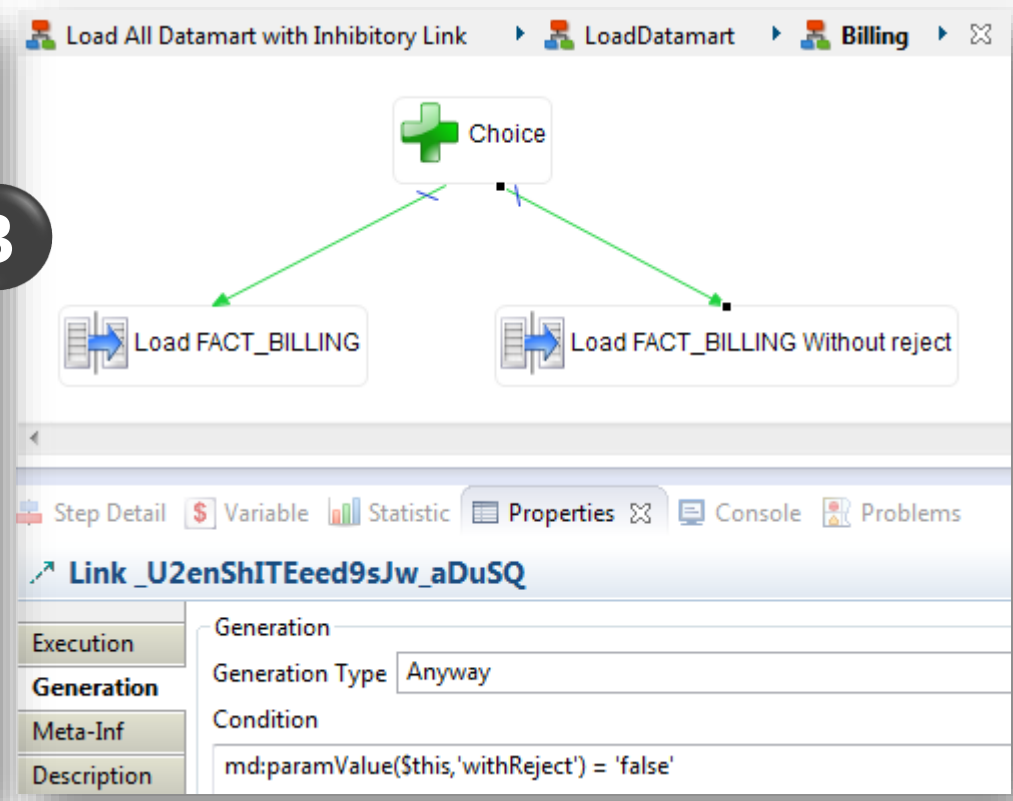

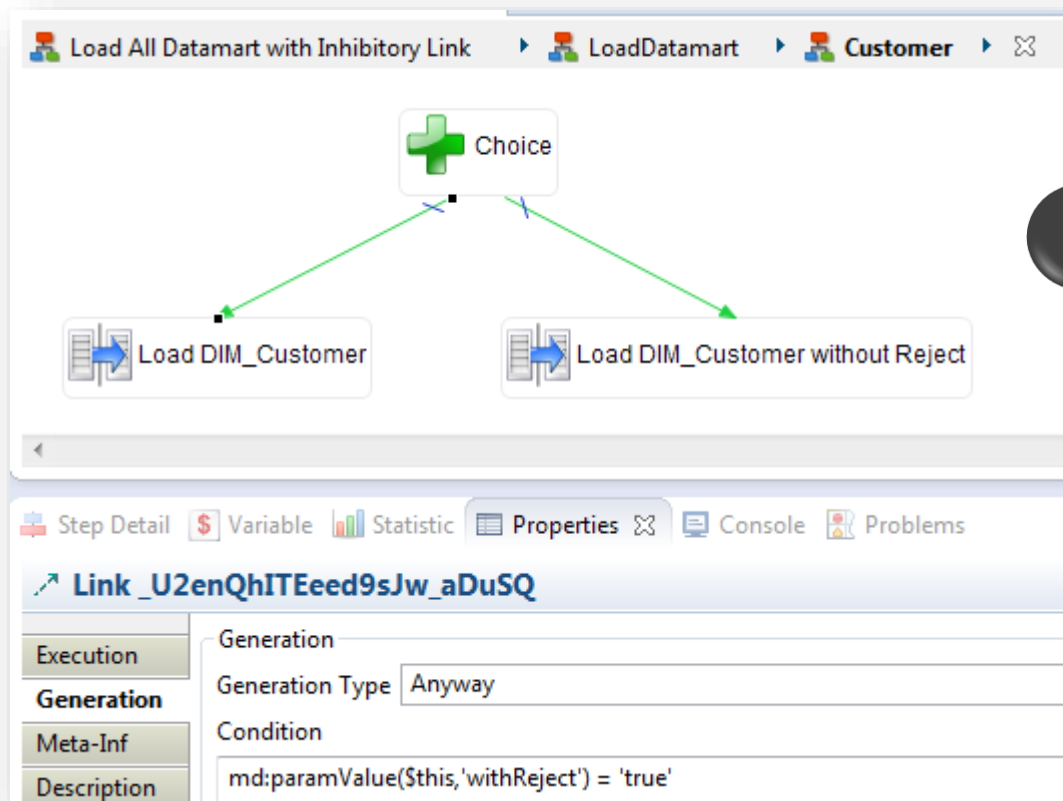

- ❖ 1 - Copy the “Load All Datamart” process and all the mappings in your exercise folder, update the process and create a parameter as below:

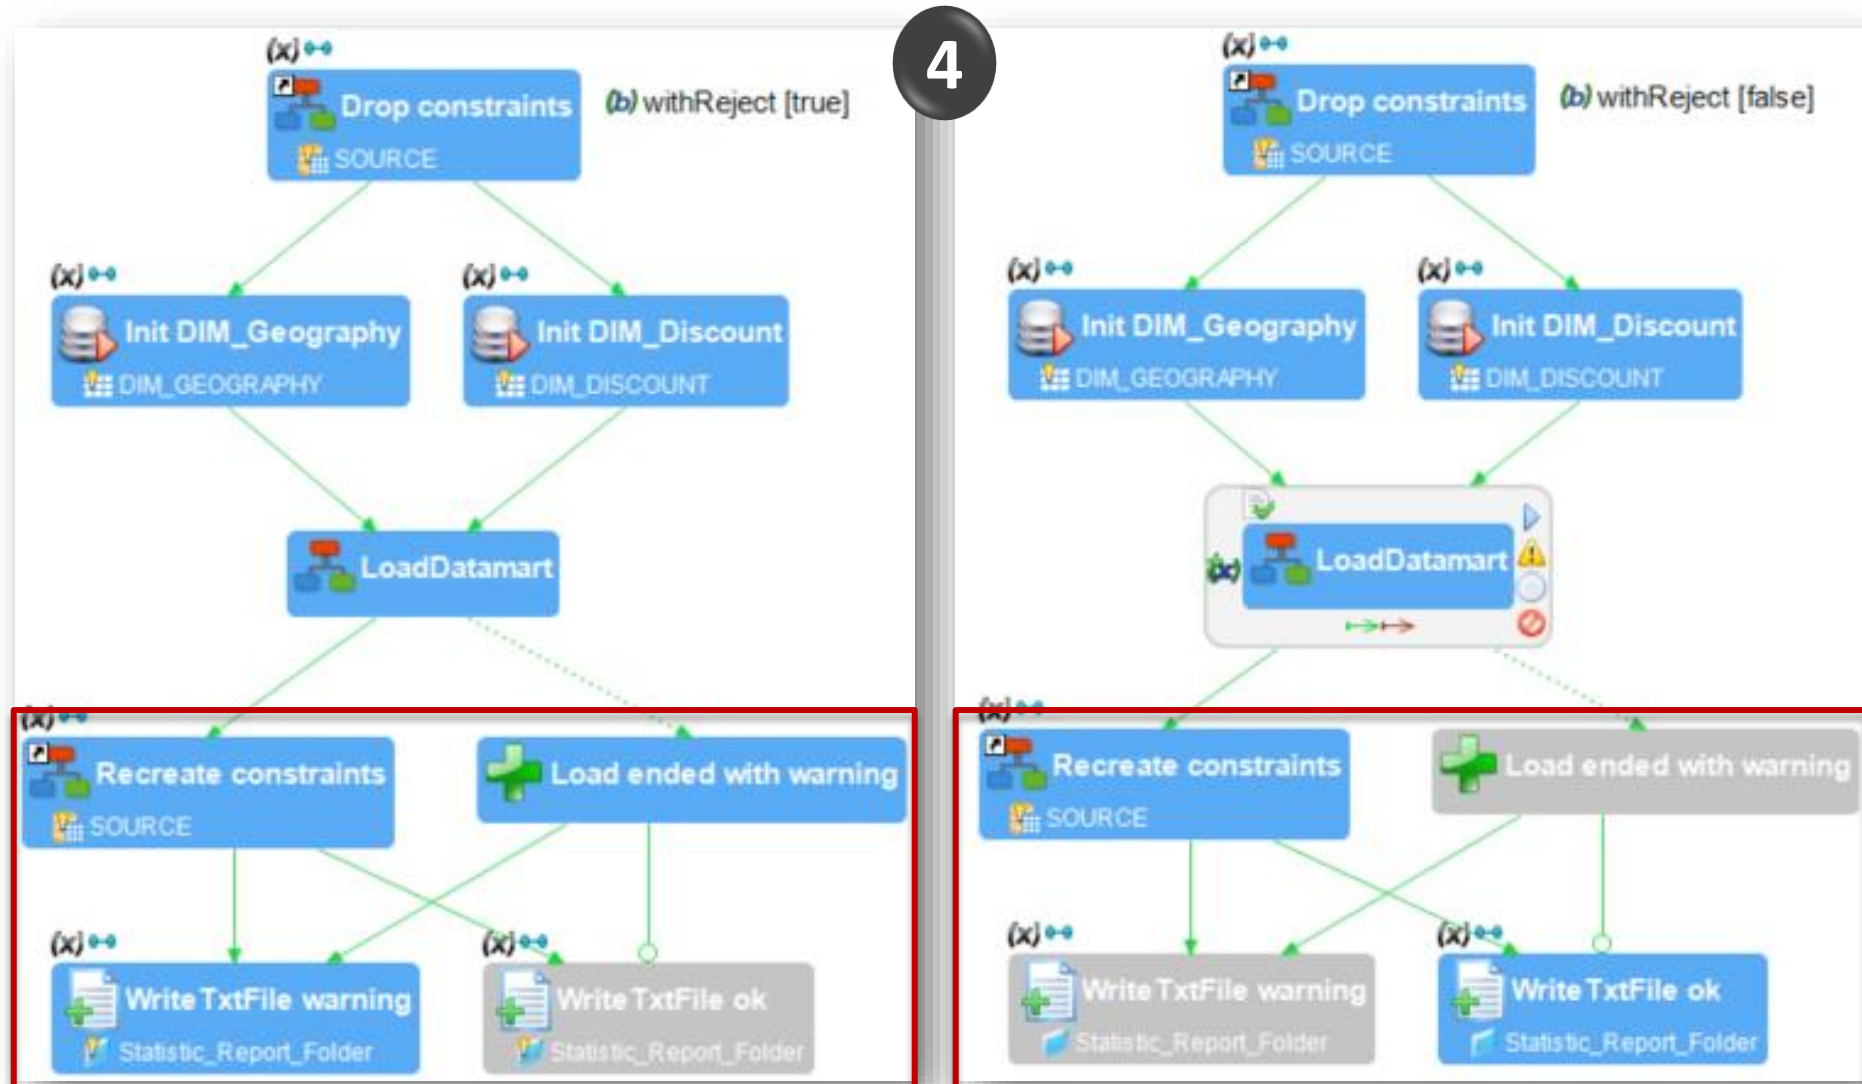

- ❖ 2 - Define the subProcess “LoadDatamart” as below:

- ❖ 3 - For each sub process (Billing & Customer), you have to test the parameter and duplicate the mapping with a version without reject in the new mapping :

- ❖ 4 - You have to test the execution with a parameter value true and false:

- ❖ 5 - the results in the generated files are described below in case of true and false value for the parameter:

5
